

## Threshold problem with response time used to subtract value of a chrono

Response times that are only used for the calculation of time in a scenario are not uploaded to the NMC server.

For these response times, threshold 0 is set by default.

Threshold is usually exceeded in practice by the corresponding chronos, which explains the Warning value = TRUE which determines the send of the DIAG file to the NMC server every time.

### **Solution:**

Set high thresholds for these "hidden" response time through the properties of the scenarios (SLA Objectives tab) in NTBR, then export to the NMC server.
